

2.

$$\begin{aligned}
 c^2 &= a^2 + b^2 \\
 &= 80^2 + 120^2 \\
 &= 6400 + 14400 \\
 c^2 &= 20800 \\
 c &= 144 \text{ m}
 \end{aligned}$$

$$\tan \theta = \frac{80.0 \text{ m}}{120 \text{ m}}$$

$$\theta = 34^\circ$$

$$\vec{d} = 144 \text{ m } 124^\circ$$

$\overline{E} 34^\circ \text{ S}$

$$\vec{v}_{\text{ave}} = \frac{\vec{d}}{t} = \frac{144 \text{ m } 124^\circ}{40 \text{ s}} = 3.6 \frac{\text{m}}{\text{s}} 124^\circ$$

$$\begin{aligned}
 v_{\text{ave}} &= \frac{d}{t} = \frac{200 \text{ m}}{40.0 \text{ s}} \\
 &= \underline{\underline{5.0 \text{ m/s}}}
 \end{aligned}$$

Lessons from the Boat. . .

Vector Addition

10. A person rows a boat directly across a river that is 300 m wide with a speed of 1.00 m/s. If the river is flowing at 4.00 m/s

- A. what will be the actual velocity of the boat? (4.12 m/s 14° to shore)
- B. How long will it take to row the boat to the other side of the river? (300 s)
- C. How far downstream does the boat go? (1.20 x 10³ m)

$$c^2 = a^2 + b^2$$

$$= 1^2 + 4^2$$

$$= 17$$

$$c = 4.12 \text{ m/s}$$

$$\tan \theta = \frac{4}{1}$$

$$\theta = 76^\circ$$

a) $\vec{v} = 4.12 \text{ m/s } 76^\circ \text{ downstream } 14^\circ \text{ to shore}$

$\tan \theta = \frac{4 \text{ m/s}}{1 \text{ m/s}} = \frac{y}{300 \text{ m}}$

c) $y = 1200 \text{ m}$

$$c^2 = a^2 + b^2$$

$$= 300^2 + 1200^2$$

$$= 90000 + 1440000$$

$$= 1530000$$

$c = 1236 \text{ m}$

b) $v_{\text{ave}} = \frac{d}{t}$

$$4.12 \frac{\text{m}}{\text{s}} = \frac{1236 \text{ m}}{t}$$

$$t = \frac{1236}{4.12} = 300 \text{ s}$$

$$\left. \begin{aligned} dx &= v_x t \\ dy &= v_y t \end{aligned} \right\}$$

Independence of x and y
